Representation of Designated Groups in the Public Service of Canada

checking if our r is working

```
print("Hello R world")
```

```
## [1] "Hello R world"
```

Analysis of Table 19

we are loading required libraries

Loading required libraries

```
#install.packages(c("readxl", "dplyr", "ggplot2", "tidyr"))
library(readxl)
library(janitor)
```

```
##
## Attaching package: 'janitor'
```

```
## The following objects are masked from 'package:stats':
##
##     chisq.test, fisher.test
```

```
library(dplyr)
```

```
##
## Attaching package: 'dplyr'
```

```
## The following objects are masked from 'package:stats':
##
##     filter, lag
```

```
## The following objects are masked from 'package:base':
##
##     intersect, setdiff, setequal, union
```

```
library(ggplot2)
library(tidyr)
```

loading the data and cleaning the names

we are going to load the data for table 1 and display the first few rows, just to ensure that our data is loaded successfully

we also cleaned the data to use numbers only, excluding the percentages

```
library(readxl)
tab19_eng <- read_excel("~/Documents/assignments/keira/cleaned/tab19-eng.xls", skip = 4, n_max = 5)
```

```
## New names:
## * `` -> `...4`
## * `` -> `...6`
## * `` -> `...8`
## * `` -> `...10`
```

```
Sys.setlocale(category = "LC_CTYPE", locale = "en_US.UTF-8")
```

```
## [1] "en_US.UTF-8"
```

```
head(tab19_eng)
```

```
## # A tibble: 5 x 10
##   `Type of Employment`   `All Employees` Women ...4  `Aboriginal Peoples` ...6
##   <chr>                  <chr>           <chr> <chr> <chr>                <chr>

```

visualization of the data

1. Drawing a bar graph showing the different distributions of employees categories across regions

i) Converted the data to numerical data
ii) Created a bar graph

```
subset_data <- subset_data %>%
  mutate_at(vars(all_employees, women, persons_in_a_visible_minority_group, persons_with_disabilities, a
            as.numeric)

subset_data_long <- subset_data %>%
  gather(key = "category", value = "value", -type_of_employment)

ggplot(subset_data_long, aes(x = type_of_employment, y = value, fill = category)) +
  geom_bar(stat = "identity", position = position_dodge(width = 0.8)) +
  labs(title = "Type of Employment by Population distribution",
       y = "Population") +
  theme_minimal() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1)) +
  scale_y_continuous(limits = c(0, 16000), breaks = seq(0, 16000, by = 1000))
```

## Type of Employment by Population distribution
from the bar graph above you can see:

- there are more indeterminate women employees compared to other employment types

1. distribution of employment across regions

```
ggplot(subset_data, aes(x = type_of_employment, y = all_employees, fill = type_of_employment)) +
  geom_bar(stat = "identity") +
  labs(title = "Number of All Employees by Employement type",
       x = "Types of Employment",
       y = "Number of All Employees") +
  theme_minimal() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

Number of All Employees by Employement type

from the bar graph above you can deduce:

- there is a high rate of intermediate employment

2. Scatter plot for distribution of women across regions of work

```
ggplot(subset_data, aes(x = type_of_employment, y = women)) +
  geom_point() +
  labs(title = "Scatter Plot Employement vs Women",
       x = "Employment Type",
       y = "Women") +
  theme_minimal() + theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

Scatter Plot Employement vs Women
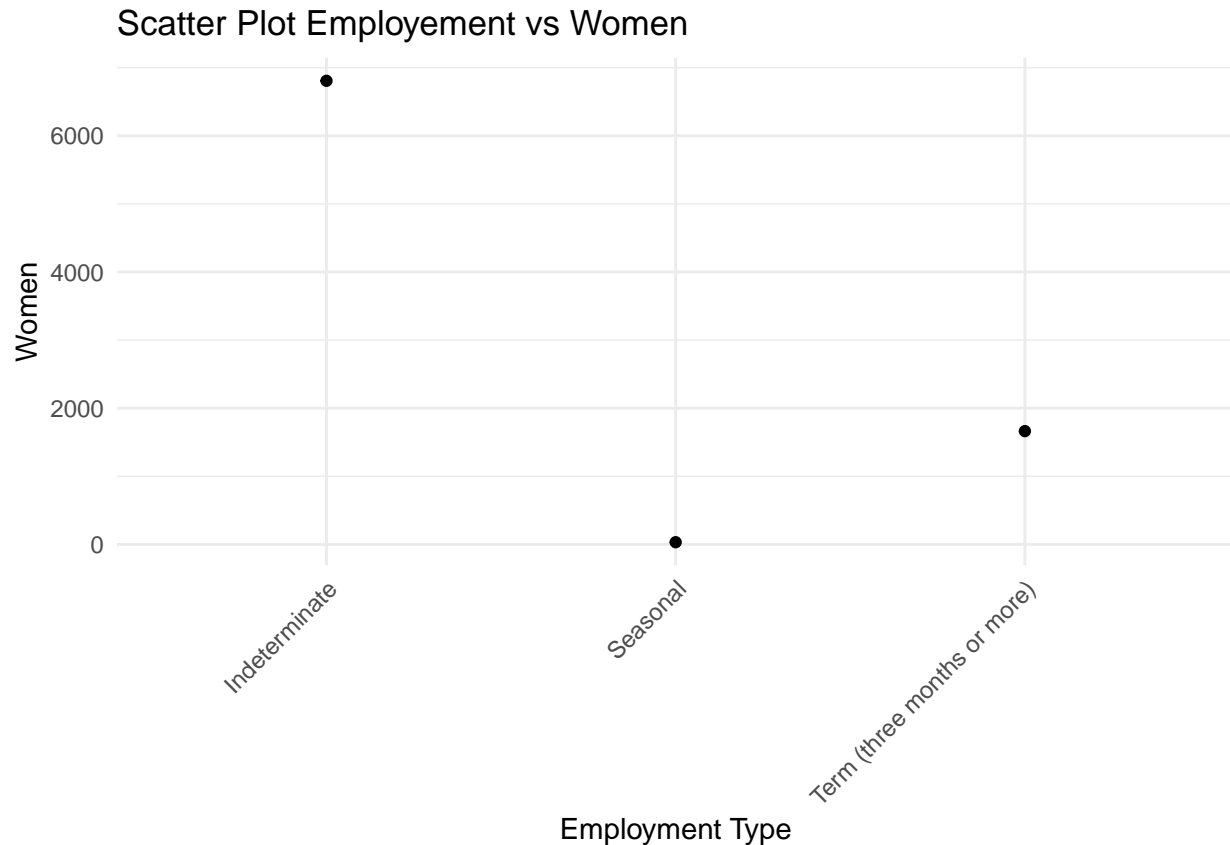

from the scatter plot above we can deduce:

- women employment is high under intermediate employment type

3. summary of how the employees are spread out

```r
summary_data <- subset_data %>%
  summarise(
    all_employees = sum(all_employees),
    women = sum(women),
    persons_in_a_visible_minority_group = sum(persons_in_a_visible_minority_group),
    persons_with_disabilities = sum(persons_with_disabilities),
    aboriginal_peoples = sum(aboriginal_peoples)
  )
summary_data_long <- gather(summary_data, key = "category", value = "value")
ggplot(summary_data_long, aes(x = "", y = value, fill = category)) +
  geom_bar(stat = "identity", width = 1, color = "white") +
  coord_polar("y") +
  labs(title = "Pie Chart of Population Distribution",
       fill = "Category") +
  theme_minimal() +
  theme(axis.text = element_blank(),
        axis.title = element_blank(),
        panel.grid = element_blank())
```

Pie Chart of Population Distribution
from the pie chart above we can deduce:

- women are the second most employed category
- Aboriginal people and person with disabilities have a few representation in the job industry
